THE COMPLETE OPENCLAW COLD OUTREACH PLAYBOOK

From Signal Detection to Closed Deals

End-to-End Agent Prompts, Service Breakdowns & Dashboard Setup

By Matt Ganzak | ScaleUP Media | THE SPRINT Training Series

Live Training #1 | February 2026

TABLE OF CONTENTS

Phase 1: Signal Detection - Finding Opportunities
Phase 2: Data Scraping - Multi-Agent Setup
Phase 3: Finding Decision Makers - Email Discovery
Phase 4: Email Validation - Cleaning Your List
Phase 5: Domain Setup - Buying & Configuring
Phase 6: Cold Email Infrastructure - Instantly.ai & Alternatives
Phase 7: Writing Personalized Cold Emails
Phase 8: Data Management - CSV & Google Sheets
Phase 9: Performance Dashboard
Appendix A: Complete Prompt Library
Appendix B: Troubleshooting Guide
Appendix C: Cost Calculator

PHASE 1: SIGNAL DETECTION

Finding Opportunities Your Competition Misses

What Are Signals?

Signals are real-time indicators that a business has a specific pain point your product or service can solve. Instead of blasting cold emails to random companies, you use your OpenClaw agent to continuously monitor the internet for these buying signals, so you only reach out to companies that are actively experiencing the problem you fix.

Types of Signals to Monitor

Signal Type	What to Look For	Real-World Example
Hiring Signals	Job postings for roles related to your solution	Restaurant posts 'Operations Manager' = scaling = YesChefOS opportunity
Tech Stack Changes	Companies adopting or dropping tools	Company ditches HubSpot = needs new CRM = your SaaS opportunity
Funding Signals	Recent Series A/B/C raises	Startup raises $5M = has budget, needs to scale fast
Pain Point Signals	Negative reviews, complaints	Bad Yelp reviews about wait times = YesChefOS opportunity
Growth Signals	New locations, expansions, press	Chain opens 3 new locations = needs operational software
Compliance Signals	Regulatory changes, new laws	New tax law = TaxSmartAI opportunity for every CPA firm
Content Signals	Blog/social posts about problems	CEO posts about 'scaling challenges' = venture studio opportunity
Competitor Signals	Competitor outages or price hikes	Major outage = steal their customers immediately

Setting Up Your Signal Detection Agent

Your OpenClaw agent will continuously scan multiple sources and compile a daily signal report.

Step 1: Define Your Ideal Customer Profile (ICP)

Before your agent can find signals, it needs to know exactly who you are looking for.

PROMPT: ICP Definition Agent

```
You are an ICP analysis agent. Help me define the perfect target customer.

Product: [YOUR PRODUCT NAME]
Description: [WHAT IT DOES]
Price: [MONTHLY PRICE]
Pain Points Solved: [LIST 3-5]

Create a detailed ICP with:
1. Company size (employee count range)
2. Industry verticals (be specific)
3. Annual revenue range
4. Geographic targets
5. Technology they likely use
6. Job titles of decision makers
7. Job titles of champions/influencers
8. Common pain points they experience
9. Trigger events indicating buying readiness
10. Keywords they use discussing these pain points

Format as structured JSON so other agents can reference this.
```

Real-World Example: YesChefOS ICP

```
{ "product": "YesChefOS",
  "icp": {
    "company_size": "5-1200 locations",
    "industries": ["restaurants","fast-casual","QSR","ghost kitchens"],
    "revenue": "$1M-$500M annual",
    "decision_makers": ["CEO","COO","VP Operations","Director of IT"],
    "champions": ["General Manager","Regional Manager","Head Chef"],
    "buying_triggers": [
      "Opening new locations", "Hiring operations roles",
      "Bad reviews mentioning consistency", "Switching POS systems"
    ]
  }
}
```

Step 2: Signal Scanner Agent

PROMPT: Signal Scanner Agent

```
You are a Signal Detection Agent. Scan the internet for buying signals
matching my ICP.

## YOUR ICP: [PASTE ICP JSON]
```

```
## SOURCES TO SCAN:
1. Job boards: Indeed, LinkedIn Jobs, Glassdoor
2. News: Google News, TechCrunch, local business journals
3. Review sites: Yelp, G2, Capterra, Google Reviews
4. Social: LinkedIn posts, Twitter/X
5. Government filings: New business registrations, permits

## FOR EACH SIGNAL RETURN:
- company_name, website, signal_type
- signal_source (URL), signal_description (2-3 sentences)
- signal_strength (hot|warm|cold)
- estimated_company_size, industry, location
- date_detected, recommended_approach

## OUTPUT: JSON array sorted by signal_strength (hot first).
Only signals from last 7 days. Target 20-50 per scan.
```

Step 3: Signal Enrichment Agent

PROMPT: Signal Enrichment Agent

```
You are a Signal Enrichment Agent. Enrich each raw signal with context.

## INPUT: [RAW SIGNAL JSON FROM SCANNER]

## FOR EACH SIGNAL ADD:
- company_website, company_linkedin
- estimated_employees, estimated_revenue
- tech_stack_indicators, recent_news
- competitors_they_use, social_proof
- pain_point_evidence (direct quotes/evidence)
- urgency_score: 1-10 rating
- personalization_hooks: 3-5 specific things for outreach

## SCORING: 8-10=Active pain, 5-7=Growth mode, 1-4=General fit
## OUTPUT: Enriched JSON sorted by urgency_score descending.
```

Real-World Signal Detection Examples

Example 1: YesChefOS - Restaurant Chain Signal

Signal: A regional chain with 47 locations posts 3 'Regional Operations Manager' listings, and their CEO posts on LinkedIn about 'challenges of maintaining quality as we scale to 100 locations.' This is a 9/10 urgency signal.

Example 2: TaxSmartAI - Compliance Signal

Signal: IRS announces new crypto reporting requirements. Your agent finds 200+ CPA firms blogging about it but none mention automated tools. Regulatory deadline creates urgency + they have the problem but no solution.

Example 3: Social Agent - Competitor Pain Signal

Signal: Major social media tool has a 6-hour outage. 150+ businesses publicly complaining on Twitter/X saying 'looking for alternatives.' Contact within 24 hours while pain is fresh.

PHASE 2: DATA SCRAPING WITH MULTI-AGENT SETUP

Turning Signals Into Actionable Lead Data

Multi-Agent Architecture

Your scraping operation uses a coordinator that delegates to specialized sub-agents. Each agent has one job.

Agent	Role	Input	Output
Coordinator	Orchestrates pipeline	Signal list	Final enriched CSV
Website Scraper	Company info from sites	Company URLs	Company data JSON
LinkedIn Scraper	Team members & titles	Company names	People data JSON
Review Scraper	Pain point data	Company names	Review summaries
News Scraper	Recent mentions	Company names	News summaries
Data Compiler	Merge into clean CSV	All outputs	Master lead CSV

PROMPT: Coordinator Agent

```
You are the Lead Research Coordinator managing specialized sub-agents.

## WORKFLOW:
1. Receive enriched signal list from Phase 1
2. For each signal, delegate to sub-agents:
   a. Company URL -> Website Scraper
   b. Company name -> LinkedIn Research Agent
   c. Company name -> Review Scraper
   d. Company name -> News Scraper
3. Collect all results
4. Pass to Data Compiler Agent
5. Quality check final output

## RULES: Process in batches of 10. Retry failures once.
Prioritize hot > warm > cold signals.
Track: {signal_id, status, agents_completed, data_completeness_score}
```

PROMPT: Website Scraper Agent

```
You are a Website Research Agent. Given a company URL, extract:

- company_name, tagline, industry, products_services
- locations (number and where), leadership_team (names + titles)
- contact_info, tech_indicators, blog_topics (last 5 posts)
```

```
- careers_page (open positions), social_links
- company_size_indicators, pain_point_clues

OUTPUT: Structured JSON. If a field cannot be found, set null.
Never fabricate data.
```

PROMPT: LinkedIn Research Agent

```
You are a LinkedIn Research Agent using publicly available data.
Use Google: '[company] site:linkedin.com/in' and '[company] [title] site:linkedin.com/in'

## FIND THE DECISION-MAKING HIERARCHY:
- C-Suite (CEO, COO, CTO, CFO)
- VP level (VP Ops, VP Engineering, VP Marketing)
- Director level, Manager level

## FOR EACH PERSON:
- full_name, job_title, linkedin_url
- decision_authority (final_decision|strong_influence|champion|gatekeeper)
- tenure, recent_activity (personalization fodder)
- email_pattern_guess (validated later)

TARGET: 3-5 contacts per company. At least 1 C-suite + 1 manager.
```

PROMPT: Review Scraper Agent

```
You are a Review Analysis Agent. Find and analyze public reviews.

SOURCES: Google Reviews, Yelp, G2, Capterra, Glassdoor, BBB

EXTRACT:
- overall_rating, total_reviews
- common_complaints (top 3-5 themes)
- specific_pain_quotes: 3-5 direct quotes about problems
  our product solves (for use in cold emails!)
- competitor_mentions, response_pattern
- recent_negative_trend (any spike in bad reviews)
```

PROMPT: Data Compiler Agent

```
You are the Data Compiler. Merge all sub-agent data into clean records.

1. Merge into single lead record per company
2. Resolve conflicts between sources
3. Calculate lead_score (1-100):
   Signal strength (40%) + Data completeness (20%)
   + Company fit to ICP (20%) + Urgency indicators (20%)
4. Generate personalization_brief (3-4 sentences for SDR)
5. Flag data quality issues

OUTPUT FORMAT (CSV columns):
company_name, website, industry, employee_count, revenue,
location, signal_type, signal_description, signal_strength,
contact_1_name, contact_1_title, contact_1_email_guess,
```

```
contact_1_linkedin, [repeat for contacts 2-3],
review_summary, news_summary, personalization_brief,
lead_score, data_quality_flag
```

PHASE 3: FINDING DECISION MAKERS

Email Discovery, Guessing, and Enrichment

Method 1: Email Pattern Guessing with OpenClaw

PROMPT: Email Pattern Guesser Agent

```
You are an Email Pattern Detection Agent.

## COMMON PATTERNS (frequency order):
1. first.last@domain.com (~36%)
2. first@domain.com (~25%)
3. firstlast@domain.com (~15%)
4. flast@domain.com (~10%)
5. first_last@domain.com (~5%)
6. firstl@domain.com (~4%)
7. f.last@domain.com (~3%)

## PROCESS:
1. Take company domain
2. Search for known emails (website, press, job postings, GitHub)
3. If found, determine pattern and apply to all contacts
4. If not found, generate top 4 pattern guesses

## OUTPUT: { domain, detected_pattern, confidence,
  evidence, guesses: [{name, title, primary_guess, alternates}] }
```

Method 2: Email Finder Services - Pricing Breakdown

Hunter.io

Plan	Monthly	Annual	Credits/Mo	Accounts
Free	$0	$0	25 searches + 50 verifications	1
Starter	$49/mo	$34/mo ($408/yr)	500 searches + 1,000 verifications	3
Growth	$149/mo	$99/mo ($1,188/yr)	2,500 searches + 5,000 verifications	10
Business	$349/mo	$244/mo ($2,928/yr)	10,000 searches + 20,000 verifications	20
Enterprise	Custom	Custom	Custom	Unlimited

PROMPT: Hunter.io API Integration Agent

```
You are an Email Finder Agent using the Hunter.io API.

API Key: [YOUR_HUNTER_API_KEY]
Base URL: https://api.hunter.io/v2

## ENDPOINTS:
Domain Search: GET /domain-search?domain={domain}&api_key={key}
Email Finder: GET /email-finder?domain={d}&first_name={f}&last_name={l}&api_key={key}
Email Verifier: GET /email-verifier?email={email}&api_key={key}

## WORKFLOW:
1. Domain Search first to see all known emails
2. Check if target contacts appear in results
3. For contacts not found, use Email Finder with name + domain
4. Verify all found emails
5. Log credits used for budget tracking

## ERROR: 429=wait 10s retry. No result=fall back to guessing.
```

Alternative Email Finder Services

Service	Starting Price	Key Feature	Best For
Apollo.io	Free then $49/mo	270M+ contacts database	Volume prospecting
Snov.io	Free then $39/mo	Email finder + drip campaigns	Budget all-in-one
Lusha	Free then $49/mo	Phone numbers + emails	Multi-channel outreach
RocketReach	$53/mo (80 lookups)	High accuracy verified data	Quality over quantity
Skrapp.io	Free then $49/mo	LinkedIn email extraction	LinkedIn prospecting
FullEnrich	$29/mo	Waterfall (15+ providers)	Maximum find rate, lower cost
ContactOut	$79/mo	Chrome extension + API	Recruiter workflows

Pro Tip: Waterfall Enrichment Strategy

Try Hunter.io first (highest accuracy), then Apollo.io (largest database), then Snov.io (budget backup). Your agent automates this cascade:

PROMPT: Waterfall Email Finder Agent

```
You are a Waterfall Email Finder. Try multiple services in sequence.

## ORDER: (stop when found with >80% confidence)
1. Hunter.io Email Finder (highest accuracy)
2. Apollo.io lookup (largest database)
3. Snov.io Email Finder (good backup)
4. Pattern guessing (free fallback)

## COST TRACKING per batch:
- Total contacts processed
- Emails found per service (with %)
- Credits consumed per service
- Cost per found email
- Overall find rate
```

PHASE 4: EMAIL VALIDATION

Cleaning Your List Before You Send a Single Email

Why Validation is Non-Negotiable

If you skip this step, you WILL destroy your sender reputation. Email providers track bounce rate. Over 2-3% bounces = your domain gets flagged = ALL emails go to spam. Every single email must be validated.

Validation Services Pricing

Service	Pricing	Accuracy	Best For
DeBounce	$10/5K; $15/10K; volume discounts	~91%	Best value. Pay-as-you-go. API available.
ZeroBounce	$16/2K; $65/10K; $110/25K	~96%	Highest accuracy + spam trap detection
NeverBounce	$8/1K; $40/5K; $80/10K	~92%	Fast (10K in 1 minute)
Bouncer	$50/mo for 5,000	~95%	Real-time API + form verification
Emailable	$30/5K; $60/10K	~93%	Good API, integrates with most ESPs
EmailListVerify	$4/1K; $15/5K; $25/10K	~89%	Cheapest for large lists
Reoon	$9.90/5K	~93%	Affordable with WordPress integration

Recommended: DeBounce for bulk (best value) + ZeroBounce for final check on hot leads (highest accuracy).

PROMPT: Email Validation Agent

```
You are an Email Validation Agent using the DeBounce API.

API: https://api.debounce.io/v1/?api={key}&email={email}
Bulk: POST https://api.debounce.io/v1/upload

## CATEGORIZE RESULTS:
- SAFE TO SEND: result='Safe to Send' or debounce_code='5'
```

```
- RISKY: result='Role' or 'Accept-All/Catch-All'
- DO NOT SEND: result='Invalid' or 'Disposable' or 'Spam-Trap'

## WORKFLOW:
1. Take master lead CSV from Phase 2/3
2. Extract all emails, run bulk verification
3. Categorize: SAFE->outreach queue, RISKY->manual review,
   INVALID->remove and log
4. Report stats: total, safe, risky, invalid, projected bounce rate

## RULES: Never send unvalidated. Re-validate >30 days old.
Accept-all: limit 10 sends/day to test. Keep bounce <2%.
```

Validation Troubleshooting

Issue	Cause	Solution
High invalid rate (>20%)	Bad data sources or stale data	Switch to better finder; reduce data age to 30 days
Many Accept-All results	Catch-all server	Send test first; if no bounce in 24h, cautiously add
API timeouts	Large batch + slow connection	Break into 1,000 batches; add retry with backoff
Credits depleting fast	Duplicates in list	Deduplicate before validating; filter obvious invalids

PHASE 5: DOMAIN SETUP FOR OUTREACH

Buying and Configuring Your Cold Email Domain

Why a Separate Domain

NEVER send cold emails from your main domain. If outreach domain gets flagged, your business emails are unaffected. Non-negotiable.

Step 1: Buy Your Outreach Domain

Main Domain	Outreach Options	Why It Works
scaleupmedia.com	scaleupmedia.co, tryscaleup.com	Variation that looks legit but protects main
yeschefos.com	yeschef.io, tryyeschef.com	Recognizable brand + different TLD
taxsmartai.com	taxsmart.io, trytaxsmart.com	Professional variations

Where to Buy: Namecheap ($8-12/yr), Cloudflare Registrar ($8-10/yr, cheapest renewals), GoDaddy ($12-20/yr). Use Namecheap or Cloudflare.

Step 2: Email Accounts

Use Google Workspace ($6/user/mo) or Microsoft 365 ($6/user/mo). Create 3-5 accounts per domain. Spread sending across accounts.

Account	Purpose	Daily Limit
matt@tryscaleup.com	Primary - CEO outreach	30-50/day after warmup
hello@tryscaleup.com	General outreach	30-50/day after warmup
partnerships@tryscaleup.com	Partnership angle	30-50/day after warmup
team@tryscaleup.com	Team angle	30-50/day after warmup

Step 3: DNS Configuration (Critical)

Without proper DNS, emails go to spam. Set up ALL THREE:

SPF Record:

```
TXT | Host: @ | v=spf1 include:_spf.google.com ~all
```

DKIM Record:

Follow Google Workspace or M365 setup wizard to generate your DKIM key.

DMARC Record:

```
TXT | Host: _dmarc | v=DMARC1; p=none; rua=mailto:dmarc@yourdomain.com
```

Custom Tracking Domain: CNAME: track.yourdomain.com pointing to your email platform tracking server.

Step 4: Domain Warmup (DO NOT SKIP)

New domains have zero reputation. Warmup gradually over 2-4 weeks:

Week	Daily Volume	Status
Week 1 (Days 1-7)	5-10/day	Building initial reputation
Week 2 (Days 8-14)	15-25/day	Positive patterns establishing
Week 3 (Days 15-21)	30-40/day	Domain reputation solidifying
Week 4 (Days 22-28)	40-50/day	Full production capacity

Instantly.ai includes unlimited warmup in all plans. Enable on Day 1, wait 14+ days before real sends.

PROMPT: Domain Verification Agent

```
You verify cold email domain configuration before outreach.

## CHECKS:
1. SPF Record exists with correct 'include'
2. DKIM key published and valid
3. DMARC policy set
4. MX records correct
5. Domain age (flag if <14 days)
6. Warmup running 14+ days
7. Blacklist check (Spamhaus, Barracuda)

## TOOLS: MXToolbox, mail-tester.com, multirbl.valli.org
## OUTPUT: {domain, spf, dkim, dmarc, mx, warmup_days,
  blacklists_clean, ready_for_outreach, issues[]}
```

PHASE 6: COLD EMAIL INFRASTRUCTURE

Instantly.ai and Alternatives

Instantly.ai Pricing

Outreach Plans:

Plan	Monthly	Annual	Contacts	Emails/Mo
Growth	$37/mo	$30/mo	1,000	5,000
Hypergrowth	$97/mo	$77/mo	25,000	125,000
Light Speed	$358/mo	$286/mo	100,000	500,000

All plans: unlimited email accounts + unlimited warmup.

Lead Gen Plans:

Plan	Price	Leads/Mo
Growth Leads	$47/mo	1,000 verified
Supersonic	$97/mo	4,500 verified
Light Speed	$492/mo	25,000 verified

Recommendation: Start with Hypergrowth ($97/mo). Growth plan's 1,000 contacts is too restrictive. Add SuperSearch ($47/mo) if needed. Total: ~$144/mo.

Alternatives Comparison

Platform	Price	Key Advantage	Limitation
Instantly.ai	$37/mo	Unlimited accounts + warmup	Features gated by tier
Smartlead.ai	$39/mo	Unlimited warmup + AI warmup	Steeper learning curve

Saleshandy	$25/mo	Cheapest + unlimited emails	Less analytics
Lemlist	$59/mo	Best personalization (images)	More expensive
Woodpecker	$29/mo	Best for agencies	Lower limits
Reply.io	$59/mo	Multi-channel outreach	Complex setup
Mailshake	$59/mo	Simple UI + phone dialer	Limited automation

PROMPT: Instantly Campaign Agent

```
You manage Instantly.ai campaigns via API.

API Key: [YOUR_KEY] | Base: https://api.instantly.ai/api/v1

## KEY ENDPOINTS:
Add Leads: POST /lead/add
  {campaign_id, skip_if_in_workspace: true,
   leads: [{email, first_name, last_name, company_name, personalization}]}
Create Campaign: POST /campaign/create
  {name, email_accounts: ['matt@tryscaleup.com']}
Analytics: GET /campaign/analytics?campaign_id=xxx

## SETTINGS:
- 30-50 sends per account per day
- Mon-Fri, 8am-5pm recipient timezone
- Stop on reply: Yes
- Track opens + clicks (custom tracking domain)
- Follow-up delay: 3-4 business days
```

Giving Your Agent an Email Box

Give your OpenClaw agent IMAP/SMTP access to monitor replies and draft responses.

PROMPT: Email Inbox Management Agent

```
You monitor an email inbox for cold outreach replies.

IMAP: imap.gmail.com | SMTP: smtp.gmail.com
Email: matt@tryscaleup.com
Auth: [APP_PASSWORD] (Google App Passwords, never main pw)

## CHECK: Every 15 min during 8am-6pm EST

## CATEGORIZE REPLIES:
1. INTERESTED: Flag hot, draft calendar link response, alert Matt
2. MAYBE LATER: Add to nurture, schedule 30/60/90 day follow-up
3. NOT INTERESTED: Thank, remove from campaigns, add to DNC
4. REFERRAL: Extract referral info, add to pipeline, draft warm intro
```

```
5. OUT OF OFFICE: Note return date, follow up 2 days after
6. UNSUBSCRIBE: Immediately remove from ALL campaigns + suppression
7. ANGRY: Remove from all, permanent exclusion, DO NOT REPLY

## DAILY 6PM REPORT:
Total replies, breakdown by category, hot leads needing action,
meetings booked, unsubscribes processed
```

PHASE 7: WRITING PERSONALIZED COLD EMAILS

The Emails That Actually Get Replies

Cold Email Framework

Under 120 words. Nobody reads novels from strangers. Goal: get a reply.

Element	Purpose	Length
Subject Line	Get them to open (curiosity/relevance)	3-7 words
Opening Line	Prove you are not a robot	1 sentence
Pain Point	Show you understand their problem	1-2 sentences
Value Prop	How you solve it (results not features)	1-2 sentences
CTA	One simple, low-commitment ask	1 sentence
Signature	Name, title (no links in first email)	2-3 lines

PROMPT: Cold Email Writer Agent

```
You write highly personalized cold emails that get replies.

## RULES:
1. UNDER 120 WORDS, no exceptions
2. No jargon (leverage, synergize, cutting-edge)
3. No fake urgency (limited time, act now)
4. Conversational tone - smart person texting, not marketer
5. ONE CTA per email
6. No attachments/images in first email
7. Max 1 link (custom tracking domain)
8. Reference something SPECIFIC about their company

## INPUT: contact info, signal data, pain_point_evidence,
  personalization_hooks, product_value_prop

## STRUCTURE:
Subject: [3-7 words, no spam words]
Hi {first_name},
[Specific reference to their company - proves research]
[Pain point with data/quotes from research]
[Value prop with specific result/metric]
[CTA: 'Worth a quick chat?' or similar]
Best, {name}
```

```
## FOLLOW-UPS:
Day 3-4: New angle, same pain. Add insight.
Day 7-8: Share case study result (1 sentence).
Day 12-14: Breakup email. Last check-in, no pressure.
```

Use Case Examples

Example 1: YesChefOS to Restaurant Chain (Hiring Signal)

Subject: your 3 new ops manager postings

Hi Sarah, Noticed you are hiring 3 Regional Operations Managers - congrats on the growth. Scaling from 47 to 100 locations is exciting but also where consistency usually breaks down. We helped a 62-location chain reduce food waste by 23% and cut new-location onboarding from 6 weeks to 11 days. Worth a 15-minute look?

Why it works: References specific job postings, names specific results, low-commitment CTA.

Example 2: TaxSmartAI to CPA Firm (Compliance Signal)

Subject: crypto reporting changes hitting Q2

Hi David, Read your blog post about preparing for new IRS crypto reporting requirements. We built an AI that automates crypto tax classification. One firm cut crypto tax prep time by 70% last filing season. Would a quick demo be useful before Q2?

Example 3: Social Agent (Competitor Outage Signal)

Subject: saw the [Competitor] outage hit you too

Hi Jennifer, Saw your post about losing 6 hours of scheduled content during the outage. We built our platform with redundancy to avoid single points of failure. Three customers switched from [Competitor] last month and haven't missed a post. Worth exploring as a backup?

Example 4: Venture Studio (Funding Signal)

Subject: congrats on the Series A

Hi Mike, Congrats on the $5M raise - saw the TechCrunch piece. We run a venture studio that has taken 14 SaaS products from concept to revenue. We typically cut 3-4 months off launch by handling the entire build so founders can focus on growth. Worth seeing how we did it for [similar company]?

PHASE 8: DATA MANAGEMENT

CSV and Google Sheets Integration

CSV vs Google Sheets

Factor	CSV Files	Google Sheets
Complexity	Simple, fewer connection points	More setup, more moving parts
Agent Reliability	Higher - agents read/write easily	Lower - API auth can break
Real-time Access	Manual updates	Live data, shareable
Best For	Agent processing, pipelines	Human review, team collaboration
Recommendation	USE FOR AGENT WORKFLOWS	USE FOR DASHBOARDS + TEAM

The Play: CSV for agent work (fewer breakpoints), sync to Google Sheets for human review.

Master CSV Schema

```
lead_id, date_detected, signal_type, signal_strength, signal_source,
company_name, website, industry, employee_count, estimated_revenue,
city, state, country,
contact_1_name, contact_1_title, contact_1_email, contact_1_verified,
contact_1_linkedin, [repeat for contacts 2-3],
review_summary, news_summary, personalization_brief,
lead_score, pipeline_stage, last_action, last_action_date,
email_sent, email_opened, email_replied, reply_sentiment,
meeting_booked, meeting_date, deal_value, notes
```

Google Sheets API Setup (Step by Step)

Step 1:

Go to console.cloud.google.com > New Project > Name it 'OpenClaw-Sheets-Integration'

Step 2:

APIs & Services > Library > Enable 'Google Sheets API' AND 'Google Drive API'

Step 3:

APIs & Services > Credentials > Create Credentials > Service Account > Name 'openclaw-sheets' > Editor role > Keys tab > Add Key > JSON > Download the key file

Step 4:

Open JSON key, find client_email. Create a Google Sheet. Share it with that email as Editor.

Step 5: Install:

```
pip install gspread google-auth
# or: npm install googleapis google-auth-library
```

PROMPT: Google Sheets Sync Agent

```
You sync CSV data to Google Sheets for human review.

## PYTHON SETUP:
import gspread
from google.oauth2.service_account import Credentials
SCOPES = ['https://www.googleapis.com/auth/spreadsheets',
          'https://www.googleapis.com/auth/drive']
creds = Credentials.from_service_account_file('key.json', scopes=SCOPES)
client = gspread.authorize(creds)

## SHEET TABS: Signals, Leads, Validated, Campaigns, Replies, Dashboard

## SYNC: Read CSV > Open sheet > Clear tab > Write headers Row 1 >
Write data Row 2+ > Format headers bold > Log timestamp + count

## SCHEDULE: Every 4 hours + final sync at 6pm
## ERRORS: 429=wait 60s retry. Empty CSV=warn, don't clear sheet.
```

PHASE 9: PERFORMANCE DASHBOARD

Tracking Everything from Signals to Closed Deals

Dashboard Metrics

Metric	Source/Formula	Target
Signals Detected Today	COUNT today's rows in Signals	20-50/day
Leads Enriched Today	COUNT today's Leads rows	15-40/day
Emails Validated Today	COUNT validated added today	30-100/day
Cold Emails Sent Today	SUM across campaigns	100-200/day
Open Rate	Opened / Sent	Over 50%
Reply Rate	Replies / Sent	Over 5%
Positive Reply Rate	Interested / Total replies	Over 30%
Bounce Rate	Bounces / Sent	Under 2%
Meetings/Week	COUNT meetings from replies	5-10/week
Cost Per Lead	Total spend / leads	Under $5
Cost Per Meeting	Total spend / meetings	Under $50

Option 1: CSV + Google Sheets Dashboard (Recommended)

Fewest connection points, most reliable. Agents write CSV, sync to Sheets, formulas calculate metrics.

Option 2: HTML Dashboard

Single-file HTML with Chart.js for live display during trainings.

Option 3: Metabase

Free open-source BI. Install via Docker on your VPS. Connect to SQLite. Overkill for starting but great as you scale.

PROMPT: Dashboard Data Agent

```
You compile metrics from all CSV files into daily dashboard reports.

## DATA SOURCES: signals.csv, leads.csv, validated.csv,
campaigns.csv, replies.csv, costs.csv
```

```
## DAILY REPORT SECTIONS:
1. PIPELINE: New signals, leads, validated today. Total in pipeline.
   Stage breakdown: new > contacted > replied > meeting > closed
2. OUTREACH TODAY: Sent, opens (%), replies (%), bounces (%)
3. LAST 7 DAYS: Same metrics, trend direction
4. CAMPAIGN BREAKDOWN: Per campaign stats
5. COSTS: Credits used per service, total daily cost,
   cost per lead, cost per meeting
6. ACTION ITEMS: Hot leads needing attention,
   underperforming campaigns, technical issues

OUTPUT: daily_report_YYYY-MM-DD.csv + sync to Dashboard sheet
```

APPENDIX A: COMPLETE PROMPT LIBRARY

Agent	Phase	Purpose
ICP Definition	1	Define ideal customer profile
Signal Scanner	1	Scan web for buying signals
Signal Enrichment	1	Enrich signals with context
Coordinator	2	Orchestrate multi-agent pipeline
Website Scraper	2	Extract company info
LinkedIn Research	2	Find decision makers
Review Scraper	2	Analyze reviews for pain points
Data Compiler	2	Merge data into clean CSV
Email Pattern Guesser	3	Guess emails from patterns
Hunter.io API	3	Find emails via Hunter API
Waterfall Finder	3	Multi-service email cascade
Email Validation	4	Validate emails before sending
Domain Verification	5	Verify DNS and domain config
Instantly Campaign	6	Manage campaigns via API
Inbox Management	6	Monitor and categorize replies
Cold Email Writer	7	Write personalized emails
Sheets Sync	8	Sync CSV to Google Sheets
Dashboard Data	9	Compile metrics
HTML Dashboard	9	Generate visual dashboard

APPENDIX B: TROUBLESHOOTING GUIDE

Problem	Cause	Fix
Emails to spam	Missing DNS, not warmed up	Verify SPF/DKIM/DMARC, warmup 2+ weeks
High bounce (>2%)	Bad data, stale lists	Re-validate, better finder, reduce age
Low opens (<30%)	Spammy subject lines	A/B test, use curiosity, avoid trigger words
Low replies (<2%)	Not personalized enough	More specific references, soften CTA
Bad agent data	Vague prompts	Add output format reqs, validation rules
Sheets API fails	Token expired, quota hit	Refresh creds, check quota dashboard
Hunter credits gone	Too many Domain Searches	Use Email Finder for specific contacts
Instantly suspended	Too fast, bounces, spam	Reduce volume, improve list quality
CSV corrupted	Commas in fields, encoding	Quote fields, UTF-8, validate after write
Rate limits	Too many requests	Exponential backoff, batch, cache results
Leads not converting	Wrong ICP, weak value prop	Review ICP, test messaging, focus hot signals

APPENDIX C: MONTHLY COST CALCULATOR

Expense	Starter (500/mo)	Growth (2K/mo)	Scale (10K/mo)
Outreach Domain	$1/mo	$1/mo	$3/mo (3 domains)
Google Workspace	$6/mo (1 acct)	$24/mo (4 accts)	$72/mo (12 accts)
Instantly.ai	$37/mo	$97/mo	$358/mo
Hunter.io	$0 (Free)	$49/mo	$149/mo
DeBounce	$3/mo	$10/mo	$25/mo
OpenClaw VPS	$10-20/mo	$20-40/mo	$40-80/mo
AI Models (Haiku/Sonnet)	$50-100/mo	$100-200/mo	$200-400/mo
TOTAL	$107-167/mo	$301-421/mo	$847-1,087/mo
Cost Per Lead	$0.21-$0.33	$0.15-$0.21	$0.08-$0.11
Cost Per Meeting	$7-11	$5-7	$3-4

ROI Math: Average deal = $3K/mo. Close 2 deals from cold outreach = $6K/mo revenue from ~$300-400/mo spend. That is a 15-20x ROI.

NOW GO BUILD IT.

Every prompt. Every tool. Every step. The only thing left is execution.

Join THE SPRINT for live implementation support.
